

Exercise: Running a security audit with Harbian

We are now going to run a security audit using Harbian. Working in the Coursera labs environment, open up a terminal and run the following commands to install, configure, and run Harbian:

```
git clone https://github.com/hardenedlinux/harbian-audit.git && cd harbian-audit
```

```
cp etc/default.cfg /etc/default/cis-hardening
```

```
sed -i "s#CIS_ROOT_DIR=.*#CIS_ROOT_DIR='$(pwd)'" /etc/default/cis-hardening
```

```
bin/hardening.sh --init
```

```
bin/hardening.sh --audit-all
```

If you have successfully executed the above command, you should a list of evaluated checks appearing on the terminal console:

[OK] - security audit successfully passed

[WARN] - security audit warning alert

[KO] - security audit failed

List all the [KO] entries after the Harbian security check

Now that you have successfully run a security check, let's list all the [KO] entries. Run the following command inside the Terminal:

```
bin/hardening.sh --audit-all | grep KO
```

At this point you should see a list of all the [KO] entries. If this is the case, well done, you have successfully identified potential issues regarding this Linux configuration.

Start thinking about some of the [KO] entries security issues that you encountered and get ready to discuss them in the next activity.
